78  The end is only the beginning.
    Your Innovation Factory is now open for business so you can start changing the world.
When we began our journey at Mendix, we wanted to solve a problem that you and countless other businesses face every single day: delivering software with traditional tools and techniques. The problem, while easy to grasp, is massively complex. The success rate of an enterprise-scale digital project is very slim, with 70% of projects either challenged or failing altogether.¹

**Why is that?**

It’s all about collaboration. Or a lack thereof. Infrequent end user involvement often results in unclear requirements. And unclear requirements are harder to address and refine when development teams use processes that are rigid and siloed. The result? A perfect storm of inefficiencies causing delayed projects fraught with issues.

We made it our mission to help you weather this storm. To do this, we needed to break down the walls between business and IT, to reform the way enterprises approached application development. We aimed to connect people with innovative ideas to the technology that would help them turn those ideas into a reality.

With low-code development, we've enabled and fostered business collaboration in over 4000 organizations of all sizes across a range of industries and geographies. Harnessing 14 years of research, development, and a myriad of successful customers, Mendix has become the leader in low-code application development, supporting a community in the tens of thousands.

We have taken this experience and transformed it into what you’re reading now: The Digital Execution Manual. With this manual, we guide you through executing your organization's digital transformation strategy and mending the rift between business and IT so you can get back to what you’re good at: Making...

Real.
What does it mean to make?

Making is delivering technology to enable and empower the makers and doers of today.

You’re a maker. You are leading your company through digital transformation. You’re implementing massive changes to digitize your company and empower everyone in the organization to be able to make applications.

For your organization, you’ve been asking, “What’s next?” That answer is digital transformation, to which application delivery is crucial. Long-cycle planning and lengthy application delivery cycles no longer support today’s customers’ needs and expectations. Whether it’s building or refining solutions that enhance engagement with your customers, resolving operational inefficiencies, or driving new business, your applications are the key value delivery mechanisms for your organization.

For digital transformation to truly take hold, you need to start asking, “What if?” What if there was real collaboration between the business and IT that enables your makers to take their innovative ideas and deliver real, tangible results. What if there was a way to let your people experiment, explore, build, develop, question and answer in a structured, repeatable and scalable way. We have your answer to “What IF?”

Welcome to the Innovation Factory

The Innovation Factory is the critical juncture where exploration meets real actionable results. It’s a process that uses constant and choreographed collaboration to produce enterprise-grade applications in an efficient, predictable manner. It’s a scalable, self-sustaining, organizational capability that enables you to manufacture that IF.

The Innovation Factory is a combination of our low-code technology and our rapid application development methodology. Your Innovation Factory’s foundation is built on a foundation that’s a convergence of three trends. Microservices are providing new ways to architect applications and infrastructure. Developers are freer than ever to concentrate on the value an application offers rather than focus on the intricacies of a messy monolithic backend. Cloud-native deployment options provide enterprises opportunities to be more scalable and agile because of its cost effectiveness and the reusability of common services. BizDevOps is a new way of collaborating across the entire development lifecycle – including business users, developers, and operations – to ensure an application is released quickly and accurately.

The Innovation Factory enables a BizDevOps approach and helps you establish a constructive and conscious common language centered around business needs, architecture, and deployment to help you make applications at scale.

When you begin your journey of digitizing your business, you need a vision and a strategy that gets you to the Innovation Factory so that you can unleash the creativity and ingenuity of your enterprise and enable makers in IT and the business to rapidly ideate, create, and deploy apps at scale.

Let us guide you through this new world of digital execution and arm you with the know-how to enhance collaboration. We’ll take you through the elements of digital execution, and the key players and pieces that enact change in your application delivery process. After, when you’re accustomed to the elements and goals of digital execution, we guide you step-by-step through building the foundation of your Innovation Factory. We also show you the Mendix tools that help you empower more people to create at scale, enable apps with smart technology, and to turn those ideas into reality.

This is your Digital Execution Manual.
The Innovation Factory doesn't start out of the blue. You need to build it from the ground up. But before going into how you build your Innovation Factory, let's get acquainted with the different elements of your digital execution journey, the key drivers to unleashing your enterprise.
Mendix has identified the core tenants of digital execution. These are the 4 P’s. Throughout this manual you’ll see that each P comes with its own set of milestones and objectives, all driving toward the goal of building your Innovation Factory.
Portfolio

A successful rapid application development model is all about identifying the right projects and creating a project portfolio of quick wins and high-value initiatives. Quick wins allow you to realize immediate success and create a wow factor, while high-value initiatives justify broader organizational change, especially when the applications are tied to relevant strategic initiatives. Mixing use cases is important to increase your portfolio flexibility in the later stages of digital execution, so include new-market applications as well customer engagement and operational efficiency.

People

The people you choose to fill out your Mendix teams are absolutely crucial to the success of your digital execution program. You need more than just enterprising low-code developers on your team. You want to find the right people with the right skills, no matter their job title.

Success starts at the top, where senior executive buy-in is a must. You need a program owner to lead the program and mandate change. Architects are critical as well, because they will help establish a target architecture, infrastructure, and governance. Product owners are key players to a successful program, because they’ll have in-depth knowledge of the business, the product, and its users and will have insight into the value that it will create. Finally, an application development manager needs to spearhead the initiative and drive the program and the cross-functional teams who will deliver on those projects.

Process

Successful digital execution means changing the way you work and establishing rapid application development processes. Agile methodologies like Scrum are a good starting point, splitting the work into sprints and basing them off user stories, but you also need to change from a traditional way of development and operations into a BizDevOps approach, speed up release cycles from quarterly to bi-weekly (sometimes even daily), and learn how to develop minimal viable products (MVPs) with fast-paced, follow-up iterations.

Platform

As you hurdle toward digital execution, the rapid application development platform you choose shouldn’t just be about new technology trends like Artificial Intelligence, Big Data, or Blockchain, or whatever comes down the line. You need a platform that also helps you improve operational efficiencies, reduce time-to-market, and foster collaboration between business stakeholders and IT. Something that addresses the present and prepares you for the future.

Seek out a platform that helps you not only deliver faster, but more accurately, so that you can produce robust applications in a matter of weeks. This is the fail-fast learn-fast approach.
Start, Structure, and Scale.

The Innovation Factory requires going through three major stages: Start, Structure, and Scale. Each stage has its own unique set of objectives, all with the aim of scaling up your application development program.

- **Start**
  - Innovation Factory foundation
  - Establish first team, value, and MVP

- **Structure**
  - Formalized methodology & architecture
  - Get predictability & continuity

- **Scale**
  - Scalable Innovation Factory
  - Continuously increase productivity & efficiency
If you need to build a mode of transportation, and you’ve never built such a thing before, would you start by building a car or a skateboard? For most people out there, you’d probably start with the skateboard. It’s not the car you want, but a skateboard gets you from point A to point B (albeit a little slower), with minimal relative effort. You’ve developed an MVP. This is what the Start stage is.

Start is about laying the foundations for your Innovation Factory. In Start, you develop applications that realize value quickly. The reason for this is two-fold:

1) You’ll be spending more time building a team and putting the necessary prerequisites in place in terms of infrastructure and process.
2) You want quick wins. Quick wins are important because you’ll use these to prove the value of your new approach, you’ll want to celebrate your first success, and gain broader support around the company.

Your objectives for the Start phase:

1. Deliver first value
2. Build and enable first team
3. Develop and deliver first MVP
4. UX design of the first app
5. Begin architecture design
If the Start stage is about establishing and proving the benefits of rapid application development, then Structure is about building out predictability and continuity. Structure is about growing from your first set of apps to a portfolio with more apps addressing multiple use cases, expanding your first team into multiple teams, and expanding your Maker Center. Structure is about taking the process of your first agile experience that you established in Start to a process that institutes shorter release cycles under strict governance. In Structure, you’re ready to move from your first cloud deployment to a multi-cloud.

Structure is where you start to formalize your rapid application development process — establishing an architecture, enabling continuous delivery, and creating governance. By establishing predictability and stability, you’re building the scaffolding for the Maker Center.

Your key objectives for the Structure stage:

1. Formalizing your processes
2. Building more apps and extending your portfolio use cases
3. Architecture design
4. Advanced level development team
5. Governance documentation
6. Automated testing
From start to scale, learn how to use Mendix to speed up and scale out app development and start delivering real value for your business. Your talent has been trained and activated in such a way that you can shift them around the organization to work on projects where their skills are best put to use. You are applying greater automation to your processes to efficiently and rapidly deliver and manage hundreds of applications with strategic impact. This includes automating deployment and maintenance to support a large portfolio, automating quality assurance to proactively monitor the maintainability of your projects, and enabling greater reusability by establishing a private app store. With these capabilities in place, you maximize value and productivity by creating distributed innovation capabilities throughout the enterprise. You have achieved continuous productivity and efficiency.

Your objectives during Scale are:

1. Talent portability
2. Delivery velocity
3. Team efficiency
Influencing Factors

We’ve identified key influencing factors that can impact the success of your digital journey, laid out across three levels of digital execution. Throughout this manual, we will highlight the influencing factors to consider at key points of building your Innovation Factory. The icons you see in the image below will let you know which key influencing factors to keep top of mind for that particular stage and milestone.
Strategic level

This level is about evaluating and proving a strategic impact, addressing transformation risk, and identifying resources to ensure success. In other words, it’s about putting into place the pieces for establishing and maturing a rapid application development vision. The key factors here are: the right executive with the right vision, a wider organizational footprint, and expanding the portfolio to include more applications across the different use cases.

Program level

The focus at the program level should be on achieving and proving ROI, a realization of the benefits, and communication. One of the key factors at this level is the program owner who owns the Mendix program and is leading change throughout the organization. Another factor is the architect who is critical in connecting the IT and business organizations and acts as what Gartner calls a Vanguard Architect; one who establishes and communicates architectural guidelines and guardrails. The third influencing factor is proving ROI, because seeing is believing. Without proving program value, it’s difficult to expand your rapid application development capability that you’re building.

Application level

The value-focus at this level should be on time, cost, and quality. To ensure the success of these application-level influencing factors, you need the right product owner from the business; a collaborative, trained, and Mendix-certified team; and to make sure that they’re delivering the right application from both a technical- and business-value point of view.
Let’s Get Making

It’s time to start laying down the foundation of your Innovation Factory. To do this, you’ll need to spin up your first Mendix team, establish processes, and celebrate the successes you’ll achieve in the early parts of your digital execution program. It’s all about firsts in the Start stage: First value, first team, your first MVP.

We’ve aligned each objective to the 4 Ps and have listed out the milestones for each and the ways to achieve those milestones. At the end of each P, you’ll also receive the Structure milestones, so you know how to not only lay the groundwork for Scale, but start building toward it.
People

Team position and organization

Before starting anything, you need the right people to make the first application and portfolio, and to help you prove the value. We’ve created the blueprint to building your first Mendix team, assessing that team, and showing how it can grow and collaborate with the business and other departments within your organization.

Find problem solvers

Find team members who care about solving business problems (rather than people who prefer to build solutions based on detailed requirements). There will be many obstacles to overcome due to existing processes and the culture of the business, so seek out people who have a “can-do” attitude.

Look for the type of people who want to test their limit and have some technical proficiency, but also understand business challenges. A host of individuals that we’ve seen successfully make the transition, come from business analysis, UX, front-end web design, and business intelligence backgrounds.

In the end, selecting the right team is the cornerstone of success, not just for your first project but for your entire rapid application development program.

Notes
Digital Execution Manual

A typical core team:

It's important to keep your team small as you build your Innovation Factory. With a small team, you can deliver new applications quickly, avoiding much of the miscommunication and delays that often come with larger development teams. Smaller teams encourage productivity and creativity. Amazon CEO Jeff Bezos's "two pizza rule" states that you should never have a meeting where two pizzas couldn't feed the entire group. The smaller the team, the more room for brainstorming and peer review (and an extra slice of pepperoni for all).

Bashir Bseirani, CEO of Avertra, saw his team become more collaborative when they started using Mendix because they can operate in a smaller team environment. "Our philosophy is, we should be able to build an app with a team big enough to eat one pizza. When Bezos decided to do his two-pizza model, he didn't know about Mendix, and he didn't know about the power of it."

A strong first Mendix team is more than just the number of people in the room. Your first Mendix team should include a core development team comprised of a combination of a professional developer — someone with technical expertise — and business developer — someone familiar with the platform that can act as a power user if needed. The key is to have developers who can collaborate closely with end users, bridging the gap between business needs and technical possibilities.

A who's who

Typical start stage:

The right team means the right product owner. The product owner acts as a stakeholder, someone who understands the value of the user stories and make sure the requirements are being met. Your product owners are critical components to your success as a team. The right product owner needs to have a vision of what you need to build, a solid understanding of the users and marketplace, and a keen ability to prioritize backlog. Make sure they have the right authority to make decisions and engage with the team daily.

A Mendix-certified developer is also highly recommended to help the team get trained on the Mendix Platform.

Some other team members to consider in the Start phase are what we call accelerators. As an example, the UI/UX person makes the app look good but also establishes a template ecosystem for future applications. There's also need for an architect to establish guidelines and think of the future state of the IT ecosystem.

One pitfall to avoid is assigning a different team member for each project role. Each member can be responsible for multiple roles. Instead of a formal structure, team members take on work based on their areas of expertise. For example, you don't need a dedicated Scrum Master for your first projects; the lead developer can fill this role on top of his or her existing development tasks.

A Mendix-certified developer is also highly recommended to help the team get trained on the Mendix Platform.
Mendix developers come with all types of skill-sets

Developers come from all parts of the business, not just IT. From your hardcore programmers, to your business-centric developers, to your tech-savvy business analysts, low-code platforms let you build teams of makers from all backgrounds.

Don’t take it from us. Hear from this range of developers on how they helped transform their companies and themselves.

“People are always talking about solving problems with software, but I don’t think it’s always problem-solving. You can add value to an existing process. Sometimes, we can just make it better.”

Citizen Developer
Yasmin Joosten | Kuehne + Nagel

“Because the product owner sits right next to us, we can quickly get feedback on what we’re developing, which makes it so much faster.”

Business Developer
Jennifer Taylor | Innovapost

“We wanted to show how quickly a project can get done with little to no overhead using Digital Execution and really allowing developers to work with free reign without the process wrapped around it.”

Rapid Developer
Russ Martin | Erie Insurance

“We with Mendix, you have to think from the database model up and the relationships between entities and build upon that. When you can do that, you are thinking completely differently and understand the relationships. This has made me a better developer.”

Activate your team

It's tempting to just focus on your new low-code platform at the start of your Maker Center. In reality, it's best to train your team on an agile development process, too, so they can collaborate effectively. This will make learning the Mendix platform easier, because you'll understand how it works. By observing an experienced Mendix developer in action, your team learns how to effectively engage business stakeholders and deliver better solutions.

Another way of training your new Mendix team is through training and certification. The Mendix Academy offers 3-day introductory courses and rapid developer certifications to help upskill employees on how to rapidly develop applications and how to use the Mendix Platform.

The most effective rapid application development teams are onsite together, ideally located with the product owner, working through frequent iterations based on user feedback. Your Innovation Factory is all about enabling creativity to solve business challenges faster. By keeping your team close together, you can keep the group excited and motivated to continuously deliver and show results.

Giving your team the right tools will also take them far. The tools used by each persona on your team will differ, depending on their technical acumen. A citizen developer, someone with limited or no programming experience, can easily pick up Mendix using Mendix Studio. Traditional developers will find themselves at home in the Studio Pro.

Team growth strategy

When building your team, you also want to build a team growth strategy so that you can expand your rapid application development program efficiently. There are a few options to do this.

Option A: The Centralized Model

In this model, there are multiple product owners, who work with a Scrum master who then directs multiple teams of developers who work on various different types of apps.

You also want to start creating and fostering a talent pool from which you can quickly and easily pull from in the case a developer leaves the team.
Option B: The Decentralized model

This model requires you to have a core development team, consisting of a Mendix engineer, an enterprise architect, designer, Scrum master, and professional developers. This group trains and enables the talent pool while deploying them from different business units.

The core team owns the application portfolios, sets up architecture guidelines, establishes best practices, and ensures agile awareness across the business while the other units build their own portfolios. This model also enables the business developers in your organization. Thinking about future state, this is where you start to scale out your Innovation Factory.
**BizDevOps vision**

Much like a team growth strategy, we recommend also creating a BizDevOps vision for your team. Rapid application development can work only as fast as the Operations allows. You could build and deliver apps at the speed of light, but they aren’t realizing value until operations makes them go live. So begin investigating what alignment between development and operations looks like in your business.

**Structure**

You want to take your team growth strategy and put it into action. Your objectives here are about expanding your original team and creating new ones.

**Sourcing and enablement strategy:**

Mendix Studio and Studio Pro cater to developers of all kinds. Because of this, you can recruit developers from atypical places. Go beyond your full-stack developers and try to find technically-minded people from the business who are focused on solving problems and making great things.

To do that, you can use the resources from the talent pool that you began cultivating in the Start stage. And you pick a team growth option that’s right for you and your business and start executing it.

**Grow and split your teams**

Your team in the Start stage was purposefully small. As your apps become more complex and gain more exposure, your team needs to grow in proportion to that. Add an architect and an UI/UX designer if they’re already not part of your team and add an operational engineer as well. Regardless of your team growth strategy, you’ll be creating more teams as well, adding more business developers and product owners from across the business.

---

You’ve read about who needs to be on your first Mendix team. Take some time to consider people you work with that would be perfect for these roles. Consider people in and out of your business. Use this space to write their names down. When you invite them onto your team, give them a token to let them know they’re going to be working on something very important and exciting.

Identify first applications to develop

It’s important that your first applications bring immediate value upon launch, because rapid application development isn’t about delivering rapidly, it’s about realizing value quicker than you have before. Remember: Build fast, build right.

One project does not equal one application. We recommend that you start with a portfolio of three applications. While the first success is always important, to truly grasp the new rapid application development process and the Mendix platform, developing multiple apps and demonstrating a repeated success is a best practice. You have a new team with a new way of working using new technology. Showing replicate success is important. Stick to application use cases that have low pre-defined requirements and a higher rate of change (innovation, customer engagement, operational efficiency).

We’ve developed a checklist of considerations to assist you in identifying the right applications for your first project. It’s almost impossible to find projects that cover all eight considerations, so we’ve categorized them as must have, should have, and nice to have.

**Influencing Factors**

| Use Case Focus & Portfolio | The App(s) Delivery |

1. **Go live quickly**
   One of the main goals of your first application is to validate your ability to rapidly bring new ideas to market.
   It’s important that you identify quick wins that can go live typically in 30 days. Select applications that are limited in scope and can stand alone in production.

2. **Make them worthy**
   Your first applications should also be highly visible within the organization. They must have the right urgency and executive support, as well as deliver tangible business value. Select applications where you’re sure the results will get noticed and your success will be shared by stakeholders.
   You want word of your initial successes to spread like wildfire throughout the organization. Suddenly, you’ll have colleagues banging at your door, saying things like, “I heard you delivered that application in 30 days. How did you do that? Will it work for my project?”

3. **Involve business stakeholders**
   Requirements are often unclear and need to be refined through collaboration with, and feedback from, business stakeholders. The goal is to illustrate the higher level of creativity and collaboration facilitated by this new rapid application development approach.
   The key to involving business stakeholders lies with the role of the product owner. The product owner knows what needs to be built. Application success is achieved when the development team and product owner work together with a passion for making applications that deliver value. Limit business involvement with your first applications to a single department. Too many people can hamper your team’s ability to make decisions quickly.
4. Ensure a desire to take the applications into production

Another important consideration is that you can take the applications into production. Doing this gives you a clearer picture of the time-to-market advantage. As an aside, starting with a prototype might lead others to believe this approach is only suitable for prototyping, which is under-selling the impact.

For instance, a Mendix customer built a customer self-service portal in six weeks, only to discover a week before go-live that their biggest competitor launched a mobile app. They pushed the application to production and within two weeks added mobile functionality while the initial version was delivering value. Rapid application delivery gives you the ability to pivot quickly and address changes in the market in matter of weeks.

5. Limit dependencies

To deliver applications in as little as 30 days, limit your applications’ external dependencies. External factors over which you have little or no control can quickly diminish the productivity advantage offered by the Mendix platform. That’s like using a permanent marker on a brand-new whiteboard.

Some dependencies to avoid:

- Integration with existing systems, particularly those where APIs aren’t defined.
- Deployment infrastructure. It’s not uncommon at large companies to wait two months for the required hardware. For this reason, deploy your first application in the Mendix Cloud. With one-click deployment, you’re able to remove all friction from the deployment process.
- Industry regulations. Often, external regulations can make for unclear requirements, which can lead to delays.

6. Don’t get bogged down in requirements

Digital innovation projects are often marked by unclear business requirements. Don’t worry; this is a good thing, because it is better to define a high-level goal or purpose versus having detailed requirements. The more requirements your first applications have upfront, the longer it’s going to take to release. Make sure that you have at least two follow-up iterations planned so that you can capture and refine requirements and build trust with the business stakeholders. This shows them that even if their requirements don’t make it into the initial MVP, they will come in the next versions.

The process of getting from idea to production is traditionally a lot of work, so when the people across the business see an idea come to fruition in just 30 days, they will be amazed.

Matt Rogers, CIO of Suez UK, a waste management company, looked for a way to quickly address gaps in his portfolio. Using Mendix, he and his department were able to do so: “Where we have gaps in our architecture, or gaps in our application portfolio, low-code enables us to build them very quickly and bring them to market.”
7_Make failures into wins

It’s ok to admit defeat. In this case, it’s actually beneficial. It may sound contradictory, but good first applications are often ones that your organization previously failed to deliver.

For instance, a Mendix customer initially failed to build an application that calculates prices because the algorithm was so specific to the business, and the .NET developer couldn’t grasp all the nuances. Using Mendix, business stakeholders and IT developers were able to take that failure and turn it into a winner, collaborate much more closely, and successfully deliver a first version of the application in a few days.

8_Make them Smart

To ensure that apps deliver the best possible experience to the user, they should be intelligent, contextual and proactive — i.e., Smart. Develop an app that could use AI to personalize a user’s experience or uses geolocation to tell you the location for the cake you ordered for your big app launch party.

“Create something that delights your audience and is worth celebrating. At Mendix, we make delighters. A delighter is putting every pixel in the right place, eliminating limitations, and making it easy to use, navigate through, and understand. Your users should feel the love in every detail.”

Johan den Haan, Mendix CTO

As you progress from the Start to the Structure phase, the looser these guidelines become. Where in the Start stage, you’re looking for simple setups with low complexity and high impact, the later stages you can increase app complexity, especially as your team’s capability is growing too. For example, you can select applications with multiple integration points, or start to work on applications that have more pre-defined requirements. By picking the right applications you will illustrate several important things:

1_You can release applications to market in an unprecedentedly short time.
2_Business and IT can effectively collaborate to deliver new innovations.
3_You can achieve results with fewer resources (small teams, low cost).
4_You are able to work with agile processes and feedback cycles.
5_Your new approach is a repeatable process, not a one-off success.
6_You will show continuous improvement using a fail-fast learn-fast approach.
### The complexity matrix

Using the complexity matrix is a great way to assess the right projects for your Start stage portfolio. Exposure is the amount of usage or availability an application has. Complexity can be defined as how technically complex is the application; i.e., how many integrations does the application require? You want to start on the left-hand side of the quadrant, which represents your team learning and feeling comfortable with the new way of working.

Take a minute to review the 8 considerations and use the checklist below to start thinking about and writing down the first applications you’re going to make with Mendix.

- Go live quickly
- Make them worthy
- Involve business stakeholders
- Ensure a desire to take the applications into production
- Limit dependencies
- Don’t get bogged down in requirements
- Make failures into wins
- Make them Smart
Deliver your first application

You’ve carefully selected your team and thoughtfully selected your projects. Now it’s time to deliver. Agile methodologies like Scrum are a good starting point and a critical component of digital execution, but not all Scrum principles work for all organizations. Also, if the business is unwilling or unprepared, the effort is in vain. You need to prepare the business for rapid, iterative development, which is why the selection of a product owner is very important.

At Zurich insurance, Senior Product Underwriter, Alex Tong, was a critical player in Zurich’s inaugural DevOps team’s first application with Mendix. Tong gave the DevOps team a deep understanding of a data capturing application that helped the underwriting process. Working together, Tong and the DevOps team were able to produce an underwriting app that’s saving Zurich underwriters days’ worth of time, allowing them more time for quoting and building business.

Agile is crucial to rapid application development because it brings an iterative, team-based approach to software development. Rapid application development teams deliver components of an application in sprints, time-boxed phases with defined durations and a finite list of deliverables planned at the start. Collaboration is key to an agile approach.

Here are some guidelines to ensure a successful delivery of your first application through rapid application development:

1. Intake workshop
This workshop is where the real collaboration begins. The purpose of the intake workshop is to define the project business goal — not what you want to build, but what you want to achieve. The meeting should include the following people:

- The project sponsor, or the leader of digital transformation initiative, who can articulate the strategic value of the new approach.
- The product owner, who can describe the problem the application should address.
- Mendix power users, a subset of end users, to enable the definition of requirements for the first sprint and who have a firsthand knowledge of the organization’s challenges and needs.

This type of interaction will help create a different attitude towards IT and set the stage with the rest of the organization. While this workshop alone won’t alone transform your organization, it gets the business to think, “This just might work.” That is a victory upon which you can build.

“Digital innovation happens at the intersection of a business person with a good idea and someone with the technical aptitude to bring it to life.”

Roald Kruit, Mendix Co-founder
2_Kickoff workshop

You cover several topics in the kickoff workshop:

- Assigning project roles and responsibilities
- Formulating a high-level delivery plan
- Creating agile awareness and a lean governance approach
- Sharing strategic business goals
- Defining clear rules of engagement

Instead of assigning roles around technical responsibilities, give people full ownership of their user stories and divide the work based on those. Thanks to the Mendix Studio and Studio Pro, business developers can do most of the work themselves. Then, when necessary, you can bring fly-in experts for specific technical issues like integration or performance tuning. Using project management tools like Jira or Sprintr can help manage the user story-based work.

Once you have defined the new rules of engagement, work out the first 10-20 user stories as a team. Go through the exercise of having one person write a user story and someone else interpret it. This helps to create a shared vocabulary and understanding, including a definition of "ready" that indicates when the team collectively feels a user story is ready for development. As a last step, prioritize the user stories for the first development sprint.

Mendix provides APIs that connect tools and services to the Mendix platform. We recommend that you try to do all the work in Mendix first before integrating with a third-party tool or service. When you start to include those, you start to increase dependencies, which is what you want to limit in the Start phase.

3_Run short sprints

Scrum, typically calls for two- to four-week sprints. With longer sprints, there’s always a threat of not going live. The faster you go live, the faster you can realize value.

A traditional development approach suggests waiting for feedback at the end of the sprint. With longer sprints, assumptions made by developers can negatively affect the latter end of the sprint when you finally demo the application because developers are not eliciting feedback early and often enough. When mistakes build up and aren’t addressed until the end of the sprint, this causes the velocity of your application development to slow down.

Mendix Studio Pro enables you to adopt an agile approach based on Scrum. With capabilities like sprints, story management, and integrated feedback management, you can easily get an Agile shop up and running in one, single environment. More importantly, you can start bridging business and IT and start developing apps that bring real value.

Holding shorter sprints helps a team that is learning not only how to collaborate with each other and across the organization but also how to estimate the complexity of the user stories that they need to build. As the app begins to take shape, you can move to two-week sprints.

Mendix Studio Pro provides several tools to enable real-time, business-IT collaboration:

- The Developer Portal — includes stories page that lets you add and edit sprints, and a social tool called Buzz where stakeholders post updates, make comments, and upload documents.
- The Feedback & Collaboration Widget — easily elicit and get feedback from all involved with the project. Beyond making comments, you can get feedback in real-time with the Edit, View and Share functions.
- APIs — Connect Mendix with third-party tools and services.
An important aspect of collaboration is listening. Bringing in the business and asking for their feedback throughout the development process tells the business that not only are they being heard, but you’re able to listen and incorporate feedback remarkably quick. Make sure to allocate time to process user feedback.

Mendix’s visual modeling lets the business actually see what you’re building; they don’t need to look under the hood and at the code to understand. This is a huge factor in collaborating and engagement. Allocating time for feedback will help the business feel, for the first time, that they are truly involved in the creation process.

4_First sprint review meeting

In each sprint review meeting, but particularly the first:

- **Show how you solve business problems.** Don’t just demonstrate features; tie the demo back to the business objectives and challenges shared at the onset of the project.

- **Make sure the UI looks good.** Users will judge the book by its cover, even early in the development process. Make sure they don’t tune out because you have underinvested in the UI.

- **Use good demo data.** The data needs to be representative so that the demo feels real to business users. They will start to get excited for the impact of the new solution.

The Mendix Atlas UI is an open source and extensible design framework that brings good user experiences to your applications. Atlas UI gives your user interfaces a simplicity, consistency, and responsiveness to allow you to brand your apps and make them usable across a range of devices.

**Demon each sprint**

Systems design can be a very abstract exercise. To make sure your developers are on the same page with your product owners and vice versa, your product owner needs to be sitting with your developers and establishing a common language among them to make sure. With Mendix Studio and Studio Pro, you can remove abstraction. Model-driven development and real-time collaboration allow you create a common, shared language among your Mendix team—developers and product owners alike. Rather than just talking about a function, a developer can easily show it in action and get immediate feedback on it.

Define value and begin to track it

Your applications should be doing a combination of three things for your company:

1. Creating new products and business models
   Apps can help you enable strategic programs that aid in reaching business objectives like launching new business models, entering new markets, and staying ahead of your competition.

2. Enhancing customer engagement
   Apps that create new products or services that attract new customers or enhance an existing product to prevent churn. Keep 'em coming back for more.

3. Increasing operational efficiencies
   Apps that help you decrease operational and IT costs through process automation and infrastructure improvements.

Influencing Factors

- ROI & Budget for change
- Program Owner
- The Vision

Core value drivers:

When you're assessing the value of your application portfolio, consider how fast you're bringing your applications to market (time-to-market), how fast you're building those applications (application velocity), and how much time and money you're saving in development (cost of development).

The higher the potential value of your application, the higher the unpredictability. That is, an application designed to reduce costs has more predictable value than one that helps you enter a new market. You can use the previously mentioned complexity matrix to help you define the value of your products. Or you can create a use case with the program owner that describes the current state of affairs and offers a description of the application idea.
## Data capture application (B2B)

### Current Situation
- Poor data quality
- Too much time spent on manual data input
- No splash

### Description of the idea (“we believe”)
We believe that this new app can improve data quality and automate data capture

### What will it solve/create? | Affected KPI’s? | Enabled by:
--- | --- | ---
Reduce time to capture data. | Mendix Studio, makers, ingenuity
Increase data integrity, and make a big splash | |
Celebrate success

Your initial applications will be a catalyst for change throughout the organization. To ensure the organization knows about the successes of the apps and understands their value, you need to celebrate success.

When you celebrate success, you create awareness for the value you’ve delivered and what it means for other individuals and departments across your organization. Celebration drives executive sponsorship, establishes broader support, and attracts new talent. According to McKinsey, involvement from company leaders is critical. “Companies with CEO sponsors are twice as likely to be high performers as companies whose CEOs are not directly engaged in digital.”

People like to be associated with success and when they see it, they will very quickly want to be a part of it.

“Mendix success doesn’t just happen. It’s planned for.”
Arjo van Oosten, Global Senior Director, Digital Transformation

Here are some tips to maximize the impact of your internal celebration:

☐ Throw a party and invite as many people as possible, not just your development team.

☐ Host the party in a central location so that other departments take notice.

☐ People love cake. To be more specific: people love free cake. Order a cake. One of our customers in the shipping industry made their cake look like a shipping container because their app increased the utilization of their containers. You could make your cake look like a volcano, because business is about to erupt.

☐ Make sure your most senior sponsor is in the room to reinforce the importance of low-code development.

☐ Captivate your audience by presenting the astonishing results of your project. Have the business show the demo.
**Structure**

Portfolio in the Structure stage is about expanding the number of apps in your portfolio, their use cases, and their complexity.

**Move to high-complexity apps**

In structure you want to move to toward the right in the complexity/exposure matrix. Only after you've established repeated success and consistent delivery velocity should you move to the upper right quadrant. This is a gradual approach. **Crawl, walk, then run.**

Make sure your team is ready to take on more complex apps. Train them and get them to be rapid and advanced developer certified through the Mendix Academy. Take the governance strategy we discuss later and put it into action.

**Portfolio/use case mix of rebuild, ideation and components**

In Start, you’ve selected your first projects, delivered them and received many accolades. In Structure, you want to expand your use cases and start increasing your output. To do this, express an “Application Ambition”. This is your statement of intent for growing your portfolio. List out how many apps you want to create, which use case they fall under, and start to estimate their value.

---

**Think about the key pieces of information you’d show off during your application launch celebration:**

Here are some starters:

1. Why you started making this app.
2. The app’s key performance indicators.
3. Your journey to building the app.
4. How the app has performed against those KPIs.
5. Key takeaways.
Process

Put governance structure in place

A core element to success is repeating it. Repeated success leads to and informs your governance around rapid application development. You need to define and implement processes and rules around application development that help you coordinate and control your application portfolio.

Governance is creating a centralized hub where you establish best practices around agile and scrum, UI/UX, and guidelines around build, deployment, and architecture. You’re assigning the people on your team responsibilities around these best practices.

Influencing Factors

- Program Owner
- Architect
- The Vision
- App(s) Delivery

Establish a retrospective cadence

To achieve this milestone, it’s first important to establish the goals of a retrospective. The retrospective should look back on the project and review successes and lessons learned.

1. Did the project achieve its business goal?
2. Did you have the right people on the team?
3. How well was the business engaged in the process?

Embrace all feedback, whether it’s perception or reality. Again, let the business know they have a voice and that their input is vital to improving future projects. Seek their advice on how to develop a more structured rapid application development approach that further enhances engagement and collaboration with other business units.

One of the most important questions to ask the business stakeholders in the retrospective is “What would you tell your friends/colleagues about this project to make them enthusiastic?” This elevator pitch is great fodder for internal feedback, with the goal of implementing this approach more broadly across the organization.

To effectively engage the business, you may have to reverse years of perception. The key is constant communication and proof. Once business users see that you have done what you said you would do — and that they can have a significant impact on the project — they will quickly embrace this new approach.
Part 3 / Let’s Get Making / Portfolio / Establish a Retrospective Cadence

**Onboarding**

We've talked about the People-focused milestones already, but Onboarding is a people-centric milestone that falls squarely into the Process aspect of Start stage. You've selected your team, but you have to give them time to learn on the job. Making mistakes, experimenting with different tools and processes is going to help you learn what works and what doesn't work for your rapid application development process.

What you learn during onboarding can also help inform your governance strategy, so be sure to record not just your successes in the start stage, but your missteps as well.

**Try framing your next retrospective around these questions:**

1. What did you Like?
2. What did you Learn?
3. What did it Lack?
4. What did you Long for?

**Structure**

You've established that it works, now it's time to codify that success. The Process milestones in Structure center around standardizing best practices and creating governance around the technical aspects of rapid application development.

**Standardize best practices and methodology**

This is what we like to call functional governance. Here you are capturing the many different processes that you've used successfully to then share with others and refer back to. Capturing the milestones of the 4 Ps — your ideation process, your release cycle, agile collaboration methods, and how you ensure quality — are all processes that should have best practices set around them.

To gain a better understanding of your successes, make sure that when you're closing your learning loops and going through the feedback process that you and your team start to include a lessons learned aspect to your retrospectives. This will help define and build your rapid application development playbook in the Structure stage.

**Establish a governance plan**

If the above milestone is about functional governance, this milestone is about technical governance. The governance plan you were visualizing at the Start stage should be up and running at this point. Set up guidelines and rules around architecture, testing/QA, and deployment to ensure that your process continues to run smoothly even with more people and more complex applications.
**Platform**

**High-level positioning**

High-level positioning is about knowing how and where Mendix fits in with the rest of your IT ecosystem. Use the Start stage to experience the benefits of instant provisioning, not just of the application environment, but all the software needed to support the entire lifecycle, from project management to repositories. Learning more about how easy it should be to deploy and operate apps shows how developers can do this themselves, and help your Innovation Factory achieve continuous productivity and efficiency.

**Deployment strategy**

The Start stage is an excellent time to start exploring cloud, and to use this knowledge as input for strategic choices in the future. You're most likely going to deploy your application on the Mendix Cloud because it's the most optimized cloud to run Mendix-built applications. Built on top of Cloud Foundry and AWS, the Mendix Cloud is the deployment solution in which Mendix provides hosting environments for you. It's available globally and comes standard with deep insights, alerting capabilities, high availability options, and backups.

But as you expand your portfolio and move from Start to Structure, you will need to consider other deployment options and moving to a multi-cloud environment. Understanding the cloud environments to which you'll deploy—for example, the security features and how they fit into your existing security framework—will help inform how you move to Structure.
Mendix applications run on the platform’s cloud-native, stateless runtime architecture that conforms to the Twelve-Factor App principles with support for modern cloud platforms such as Docker, Kubernetes, and Cloud Foundry. Mendix applications (and you) benefit from auto-scaling, auto-provisioning, auto-healing, low infrastructure overhead, continuous integration and continuous deployment and cloud interoperability, all out of the box.

With the Mendix platform, you can package and deploy your applications to the cloud provider of your choice with one-click deployment. This feature automatically creates the appropriate deployment package (like Docker or Cloud Foundry) and supports the creation of build packs for on-premises or infrastructure-as-a-service deployments.

Data and integration strategy

Similar to your deployment strategy, you also want to begin considering what your data and integration strategy looks like with Mendix and the rest of your IT ecosystem. You need to consider your architecture strategy, too. This is an opportunity for that vanguard architect you elected to come in and understand what architecture works best for your development program.

Part of building a successful Innovation Factory is moving away from a monolithic architecture to a microservices set up. Your vanguard needs to investigate if microservices is right for your business and evaluating its benefits. Think it is right for your business.

Microservices are a historical improvement in the way we design, build, and manage IT assets. To us, there’s no more productive combination than a microservices architecture and the use of a low-code platform.

Small, autonomous DevOps teams use microservices to produce deployable components that fulfill a business function autonomously. Use microservices to model your IT landscape closer to the way a business is run. This not only better bridges the gap between IT and business stakeholders, but also can drastically improve flexibility and time-to-market.

Moving to the cloud and microservices in conjunction with using Mendix can help you realize application development velocity increase by five or ten times.

Structure

You’ve established deployment and integration strategies, now it’s time to execute. The Structure objectives of Platform are about developing reusable components and expanding out to a multi-cloud strategy.

Develop reusable components

A successful move from Start to Structure means developing reusable components to save time later in the development cycle. You need to first establish a reusable component strategy and define how reusable components are used, maintained and where they’re stored.

Assign a development team to solely work on reusable components. This team will be in charge of not only creating but maintaining the components as well. This team should store the components on the enterprise app store.

Deployment strategy

In start, you used Mendix Cloud to deploy your first set of projects. But as you grow your teams and expand into multiple business units, you need to start considering a multi-cloud strategy.
You did it.

Although it was tempting to think about using Mendix Studio and Studio Pro in their entirety from the start, you chose to focus on the people and process. You've got some amazing first results and some great takeaways that prove that your organization can adopt a new way of working.

You've successfully laid the foundation to your Innovation Factory. You've hit the milestones for each of the 4 Ps and have:

1. Delivered your first value
2. Built and enabled your first team
3. Developed and delivered your first MVP
4. Designed UX for your first app
5. Began your architecture design

Take a moment to admire your work and think about next steps. Remember, the key to moving from Start to Structure is not success, but repeating it. Repeated success shows that you've ironed out any wrinkles in the process, have smoothed out any kinks in your first team, and have showcased the value you've realized from your portfolio.

<Part 4>

Go make it.

Congratulations, you’ve reached the end.

Well, the end of this manual anyway. In fact, this is just the beginning. Consider this your commencement to a new way of collaborating and building amazing things.

So what’s next for you?

Now you are armed with the know-how to go out and successfully digitize your organization.

Taking your company from being digitally disrupted to digitally innovative is not done in a day. Use the steps we’ve laid out in this guide so that you, your developers, your business analysts, your customer success managers, your marketing team, your finance department, your HR representative, your sales force – the whole enterprise – can go make answer the question “What if?” and turn the unimaginable into reality.

Go make it.
